

Needle and syringe programme in prisons

20 years of evidences, 20 years of advocacy: *It's time to scale-up!*

English – Русский

In prisons, the prevalence of HIV, HBV, and HCV tends to be much higher than in the community. People who inject drugs are overrepresented, and some do inject in prisons. Still the access to harm reduction in prisons is very limited and far behind the access in the community.

Needle and syringe programme (NSP) is a key element of the HIV responses in over eighty countries, yet HIV response in prisons lags far behind. Twenty years after the first needle and syringe programme was implemented in the prison of Hindelbank (CH), only a hand full of countries extended this service in prison settings.

The evidence of the effectiveness and feasibility is clear and the time to scale up is now!
